

BRICK. — Pitch Doc

Vision:

I wanted to see if I could sell plain red brick as a \$499 luxury item. Knowing people get bored in seconds, I had to keep them hooked. I designed a luxury page that contrasts minimal aesthetics with high-energy interactive moments, like a cinematic video hero, smooth scroll storytelling, a sticky CSS 3D brick, and a stacking minigame.

Tools & Prompting Style:

I built the site using HTML, CSS, and JS. For the AI, I used Veo 3 for the striking video background, Nano Banana for assets, and Antigravity to code it. My prompt was strictly step-by-step. Instead of asking for the whole site up front, I guided Antigravity component-by-component, tweaking intersection observers and game logic until it felt totally seamless.

Satisfaction:

I'm thrilled. The site feels super premium but still playful. It proves that if you collaborate closely with AI, you can make a literal rock feel exciting.
